Adjustment procedure

Adjustments

Location of adjustment controls

Preparation

IMPORTANT

For all the adjustments on the module, the projector has to operate on a signal with the highest **used** line frequency.

Adjustment

Adjustment of the pulse width PULSE 1 and PULSE 2

- Connect an oscilloscope to the pin 3 of the IC39.
- Adjust the potentiometer P1 for a pulse 1 duration of 0.5us.
- Adjust the potentiometer P2 for a pulse 2 duration of 2.5us.

Adjustment of the potentiometers

P3: DC Offset switching level

P4: Hor-Par/Vert-Sawt DC Offset

P5: Clamping level Hor Parabola

measurement points for the adjustments

Adjustment of the potentiometer

P4: Hor-Par/Vert-Sawt DC Offset

P5: Clamping level Hor Parabola

- Connect an oscilloscope to the pin 10 of the IC30.
- Adjust the potentiometer P4 until the DC Offset is at GROUND-level
- Adjust the potentiometer P5 until the clamping level of the Horizontal parabolas are at GROUND-level

Adjustment of the potentiometers P3: DC Offset switching level

Attention: be sure that the input signal for adjustment operates on the highest used line frequency.

- Connect the second probe of the oscilloscope to the pin 1 of the IC39.
- Adjust the potentiometer P3 until the switching transient matches horizontal parabola inversion point.

Adjustment of the potentiometer P6: Clamping level Vert Parabola

- Connect the probe of the oscilloscope to the pin 1 of the IC30.
- Adjust the potentiometer P6 for a correct clamping level of the Vertical parabola (see fig below).

Technical description 'CONVERGENCE DRIVER' module R762454

Introduction.

The Surface Mounted Device (SMD) technology applied in the driver module makes servicing of the module not easy and requires the correct tools. The description of the schematics will then also be limited to the essential functions.

Two trigger pulses are generated to synchronize the sawtooth generator and the dynamic boosting up of the power supply. The sawtooth waveforms are clamped to a (ground) fixed level during one part of the scanning (left/right or top/bottom) and adjusted in amplitude for linear correction on the scan per color. Multipliers produce parabolic waveforms which undergo the same functions for non linear corrections. A combination of the clamped signals, and a modulation on either a sawtooth or parabola is what is needed for the coner convergence. All the waveforms for one color are summed with an amplifier and amplified by a DC amplifeir in the OUTPUT module.

Trigger Pulse generation Pulse 1 and 2

The HDR_CONV is speeded up and inverted with Q603. The negative pulse at the collector triggers on the negative going transient the monoflops of IC9 and IC19.

Pulse 1

The width of the positive output pulse at pin 13 of IC9 is adjusted with P1. The pulse train is integrated with IC15 dtermines the current of the source Q9. This current adjusts the width of the pulse at the output pin 5 of IC19. This width is a bit less than the line period. When the opposite polarity output is taken from pin 7, this pulse starts just before the end of the scanning and can be used to trigger the horizontal sawtooth generator.

Pulse 2

The pulse output at pin 13 triggers on the positive going transient the second monoflop in IC9. The width of the output pulse at pin 5 is adjusted with P2. Through the buffer Q5 the pulse is available for boosting up the supply voltage of the power end stages. Note that this pulse is also added via D38 to pulse 1.

Horizontal axis conver- gence

The capacitor C602 is charged up through the current source Q2. In order to stabilize the amplitude, irrelevant the line frequency, the sawtooth is buffered, and integrated with IC3 / C7. The resulting voltage adjusts the charging current of the current source Q2 and the amplitude is set with R2/R602.

The sawtooth is inhibited by the clamper Q22 when the current consumption of the power end amplifiers is too big (see Power Output stages).

OPAMP IC3 (5-6-7) amplifies the sawtooth in order to supply the IC4, IC16 and the multiplier IC20.

The voltage comparator IC16 (5-6-7) transforms the sawtooth into a squared Horizontal Switch Pulse of 24 V (+ / - 12V). This switch signal is used to clamp either the ramp or the parabola during the first or second half of the horizontal scanning. Note that the clipping level is variable with the voltage that drives the current source of the sawtooth generator. The multiplier IC20 (AD633) generates a horizontal parabola HP+. The next OPAMP shifts the DC-level by clamping the middle of the parabola to a voltage adjusted by P5 (approx. 0 volts) in order to compensate the tolerances of the multiplier.

The convergence at horizontal frequency with the ramp and parabola waveforms in the zones 11 - 14 are adjusted in IC1-IC2-IC601-IC602.

The waveforms are each time clamped with a clamping transistor served by the horizontal switch pulse. Two opposite phased waveform are each time applied to the potentiometers in the digitally controlled potentiometers.

Vertical axis convergence The vertical sawtooth generator is built in a similar way as the horizontal sawtooth generator, discussed above. The much lower frequencies here allow the use of the MUXDMUX IC46 (4053) in stead of the clampers.

The Vertical Switch Pulse is passed through the RS flip-flop IC39 which is clocked with the pulse 1 in order to make the transition coincide with the trigger or start of the horizontal sawtooth. This avoids a jitter for interlaced signals.

North-South / East-West and Midline corrections For above corrections we need horizontal waveforms with an amplitude that depends on the vertical position or vertical scanning. The waveforms must be modulated on a vertical sawtooth or parabola. This modulation is performed by IC29 (MLT04). The four different waveforms are all applied to the "X" and "Y" inputs and the modulated waveforms are the "W1 - W4" pins.

The corrections, called GEOMETRY corrections, are added to the CORNER and AXIS corrections in the "Summing Amplifiers".

East - West corrections

Two types of corrections (referred to as "skew" and "bow") are required to correct the projection angle and the aberrations of the optical system.

The HSVS (Horizontal Sawtooth modulated on a Vertical Sawtooth) and HSVP are used for this.

The HSVS is first amplified with an OPAMP in IC30 and then clamped with Q11 and Q10 served with the "R" and "S" switching signals. The LS+ and LS- (Left Skew) and RS+ / RS- (Right Skew) are fed to two digital potentiometers in IC13 and the adjusted outputs are sent simultaneously to the three convergence coils.

HSVP is first inverted and amplified and then clamped during the first or second half of the scan. The RB+/- and LB+/- are applied to the digital potentiometers in the same IC13 and the outputs also feed the three convergence coils.

North - South Corrections

Two type of waveforms are modulated on a vertical sawtooth VS, Horizontal Sawtooth (HS) and Horizontal Parabola (HP). The HSVS from IC29 (sheet 3) is capacitively coupled to the MUX DMUX IC46 (sheet 2) and in stead of clamping, the signal it is switched with the "vertical switch pulse" for a split of top and bottom.

The TK (Top Keystone) and BK (Bottom Keystone) signals are adjusted in IC14. Since there is a correction per color the different outputs of the digital potentiometers are gathered per color and will be added to the other corrections in the summing amplifiers.

Midline Corrections.

For the vertical and horizontal midline skew and bow corrections, the non-modulated waveforms HP- / +, HS+ / - are adjusted in amplitude with IC42 and simultaneously applied to the vertical and horizontal convergence coils of the three crt's.

Corner convergence.

The four corners are each time split into 4 zones. The generation of the convergence signals for the corners is similar for these four corners. The only difference is the clamping or switching period. A split top / bottom is realised with a MUXDMUX switcher and a left / right split with clamping transistors.

We limit the explanation to one corner and one zone (1).

Zone 1 is the cross section of the extreme left vertical axis and the extreme top horizontal axis. We need to start with a Horizontal Parabola (=extreme left vertical axis) modulated on Vertical Parabola (= extreme top horizontal axis).

This signal is called HPVP' on sheet 5. The clamping transistor Q16 clamps this signal during the second half of the horizontal scan and then the signal is called Z1+Z20. This signal is now split into top / bottom (Z1 and Z20) by the MUXDMUX IC12 (see sheet 4). Z1 and Z20 are now prepared for the digital potentiometer IC35 by the buffer - OPAMP IC37 to get Z1+ and Z1- (same signal with opposite polarity). These signals are then adjusted in IC35 and used for the red and blue. The outputs are added in the summing amplifier to the rest of the corrections. (Geometry, Axis).

Summing amplifiers.

All the corrections for the horizontal convergence coils are added per color and amplified with an MC34081. These OPAMP's are supplied with + / - 12V and since the non-inverting input is at ground level, the average output of these OPAMPs is around zero volts. This is required by the output power amplifiers for a balanced load of the (complementary) output stage.
